

*Workshop on Uncertainty in Automation, ICRA 2011*

# Aerial Robots for Construction

**Vijay Kumar**

UPS Foundation Professor

Departments of Mechanical Engineering and Applied Mechanics

and Computer and Information Science

Member of the GRASP Laboratory and the

Graduate Group of Computational Biology

**University of Pennsylvania**

# Cooperating Robots and Assembly

ABB

Kuka

Kiva Systems

Shimizu

# Unmanned Air Vehicles

**Aerovironment Black Widow – 2.12 oz.**

**UCB Smart bird**

**Boeing/ Insitu Scaneagle – 33 lb**

**Gen. Atomics – Predator B – 7,000 lb**

**BAE Systems Microstar – 3.0 oz.**

**U. Penn Piper cub 6 lb**

**Stanford DFLy**

**AAI Shadow 200 – 328 lb**

**Boeing X-45A UCAV – 12,195 lb (est)**

**Astec Hummingbird**

**Allied Aero. LADF 3.8 lb**

**Aerovironment Pointer – 9.6 lb**

**Bell Eagle Eye – 2,250 lb**

**Northrop-Grumman Global Hawk 25,600 lb**

**UAV Weight**

# Assembly

- Structured
- Mass/Batch
- Indoor
- Human intervention usually always possible
- Process tolerance < 0.1 mm

# Construction

- Unstructured
- Customized
- Outdoor
- Potentially remote, hostile environments
- Process tolerance > 5 mm

# Goal

## Assembly and Construction of 3-D Structures

# Goal

## Assembly and Construction of 3-D Structures

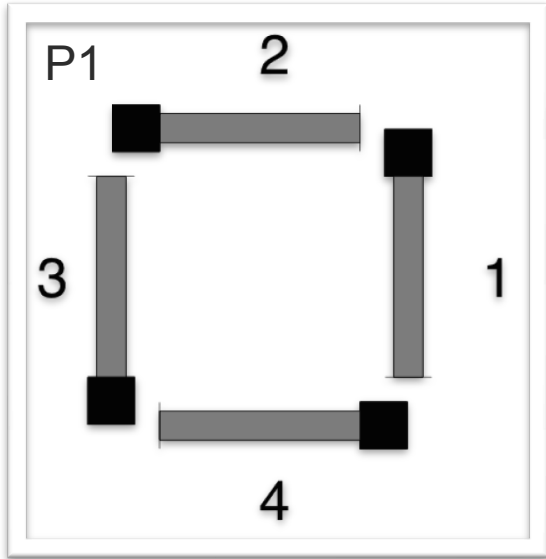

This talk ...

### Special Cubic Structures

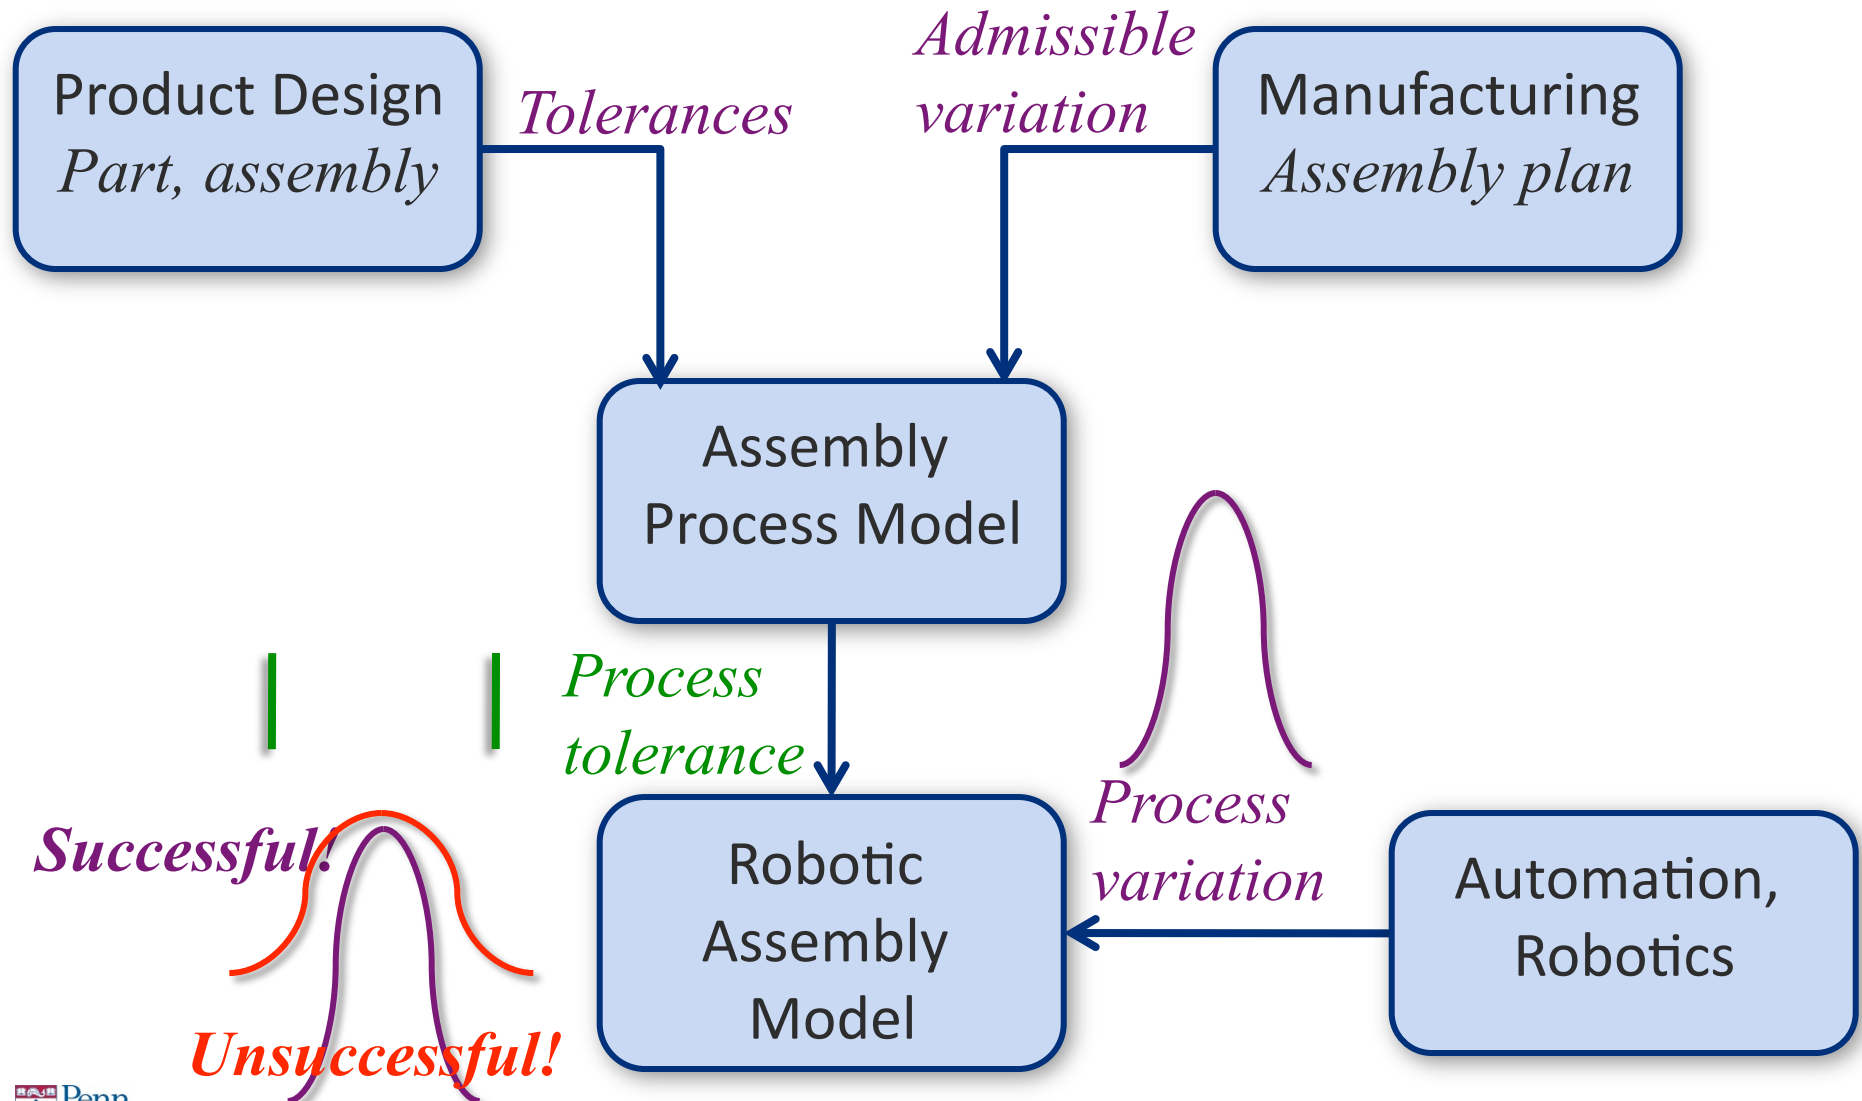

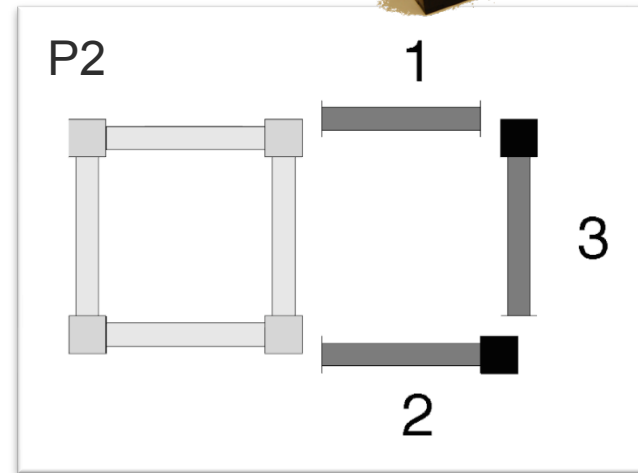

# Assembly Primitives

# Tolerances and Variation

# Assembly Primitives

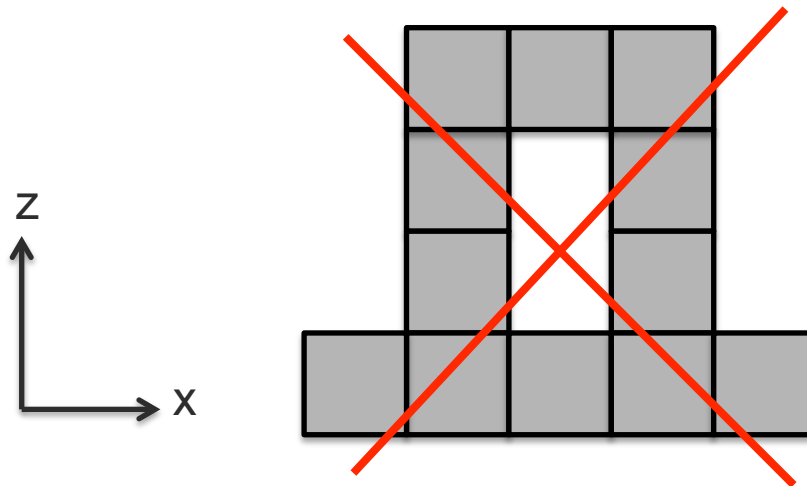

# Special Cubic Structures

Structures consisting of layers/strata

- No holes in any 2D stratum

- No cantilevered sections

# Wavefront Raster (WFR) Algorithm

1: Build any square in the 2-D region

2: **while** not finished **do**

3:     mark squares immediately connected to already built region

4:     **for** (leftmost column) to (rightmost column)

5:         build marked squares in column from bottom to top

# Quad Rotors

# Cooperative Grasping and Lifting

$$\mathbf{u}^* = \arg \min_{\mathbf{u}} \{ \mathbf{J} \mid \mathbf{A}\mathbf{u} = \mathbf{w} \}, \quad \mathbf{J} = \sum_i \mathbf{f}_i^T \mathbf{Q} \mathbf{f}_i$$

# Part Bins

# Gripper

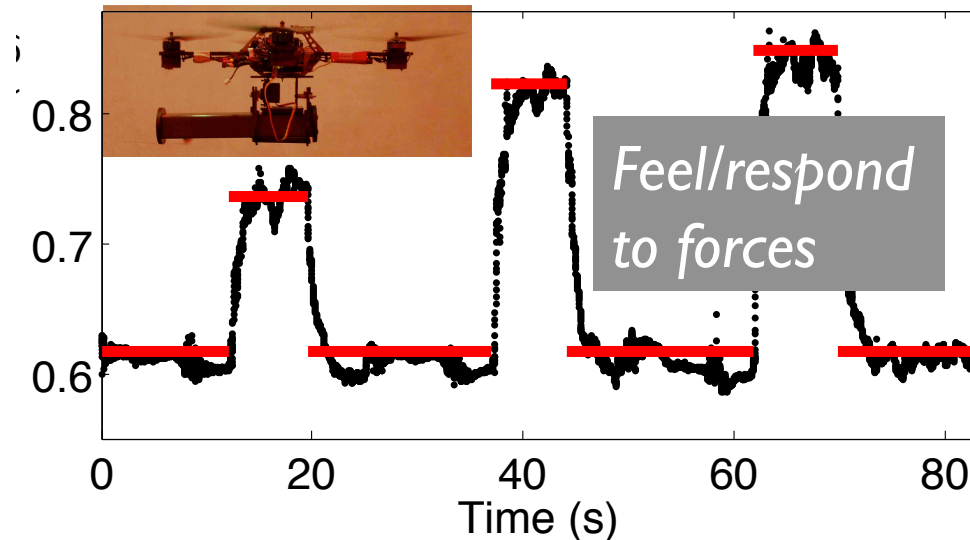

# Force Feedback

- Can estimate mass, moments of inertia
- Confirm stable prehension

# Assembly Modes

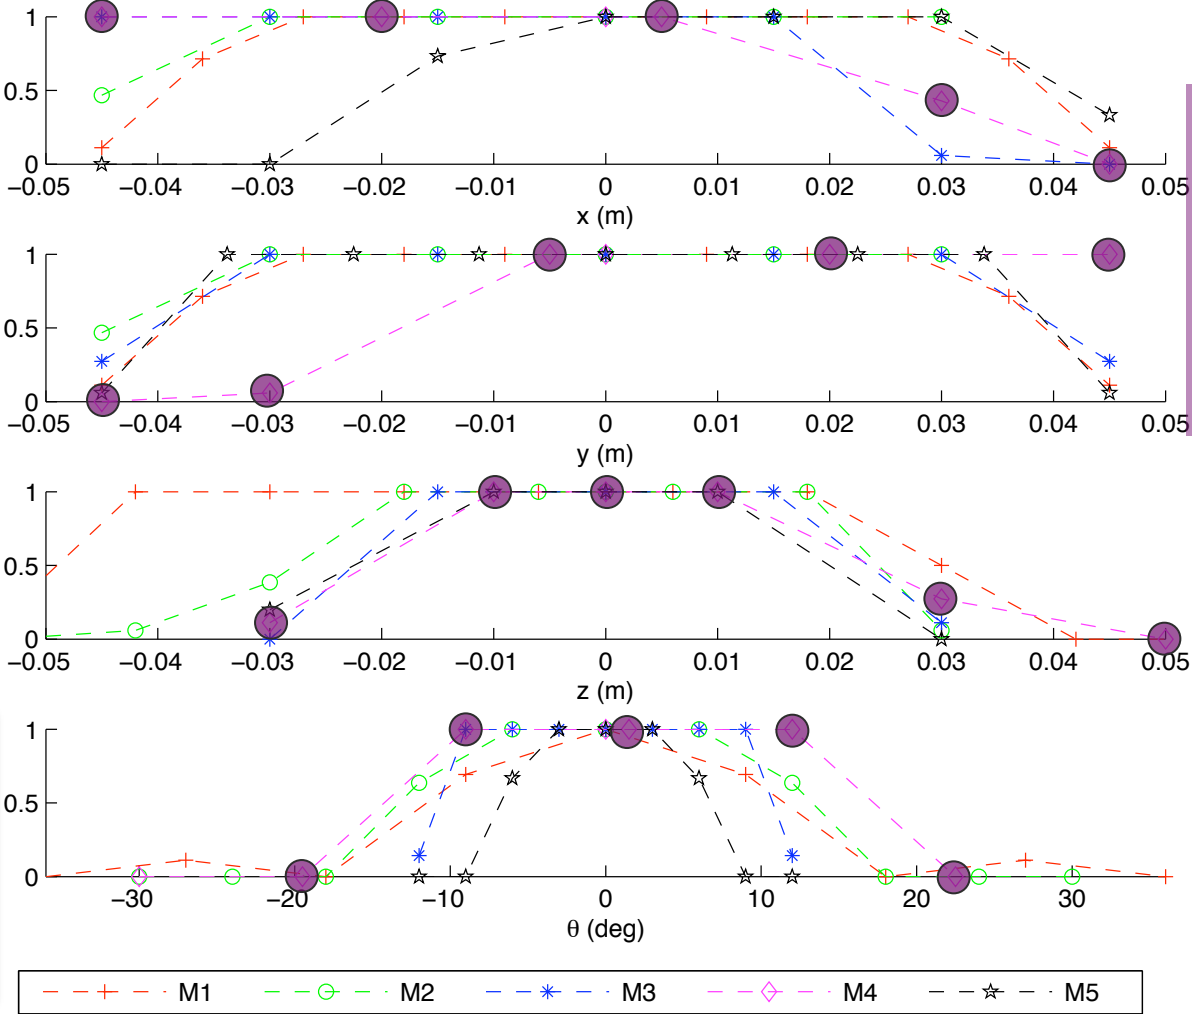

# Assembly

# Assembly Errors

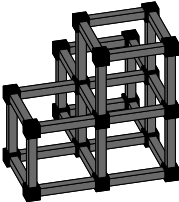

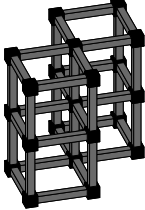

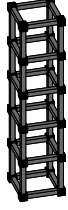

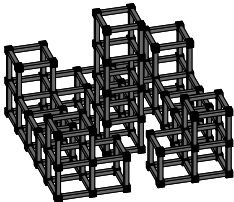

# Assembly Results with Three Robots

Simulation

				
Number of Parts	32	34	40	192
Successful Attempts	Trial 1	32	33	40
	Trial 2	32	34	39
Actual Time	449.6	486.6	588.2	
	450.7	486.2	587.3	
Column retries	5	3	8	
	5	1	3	
Beam retries	4	2	5	
	5	2	1	
Time (in simulation)	443.6	480.4	581.9	2642.0

# Challenges

- Distributed assembly

# Challenges

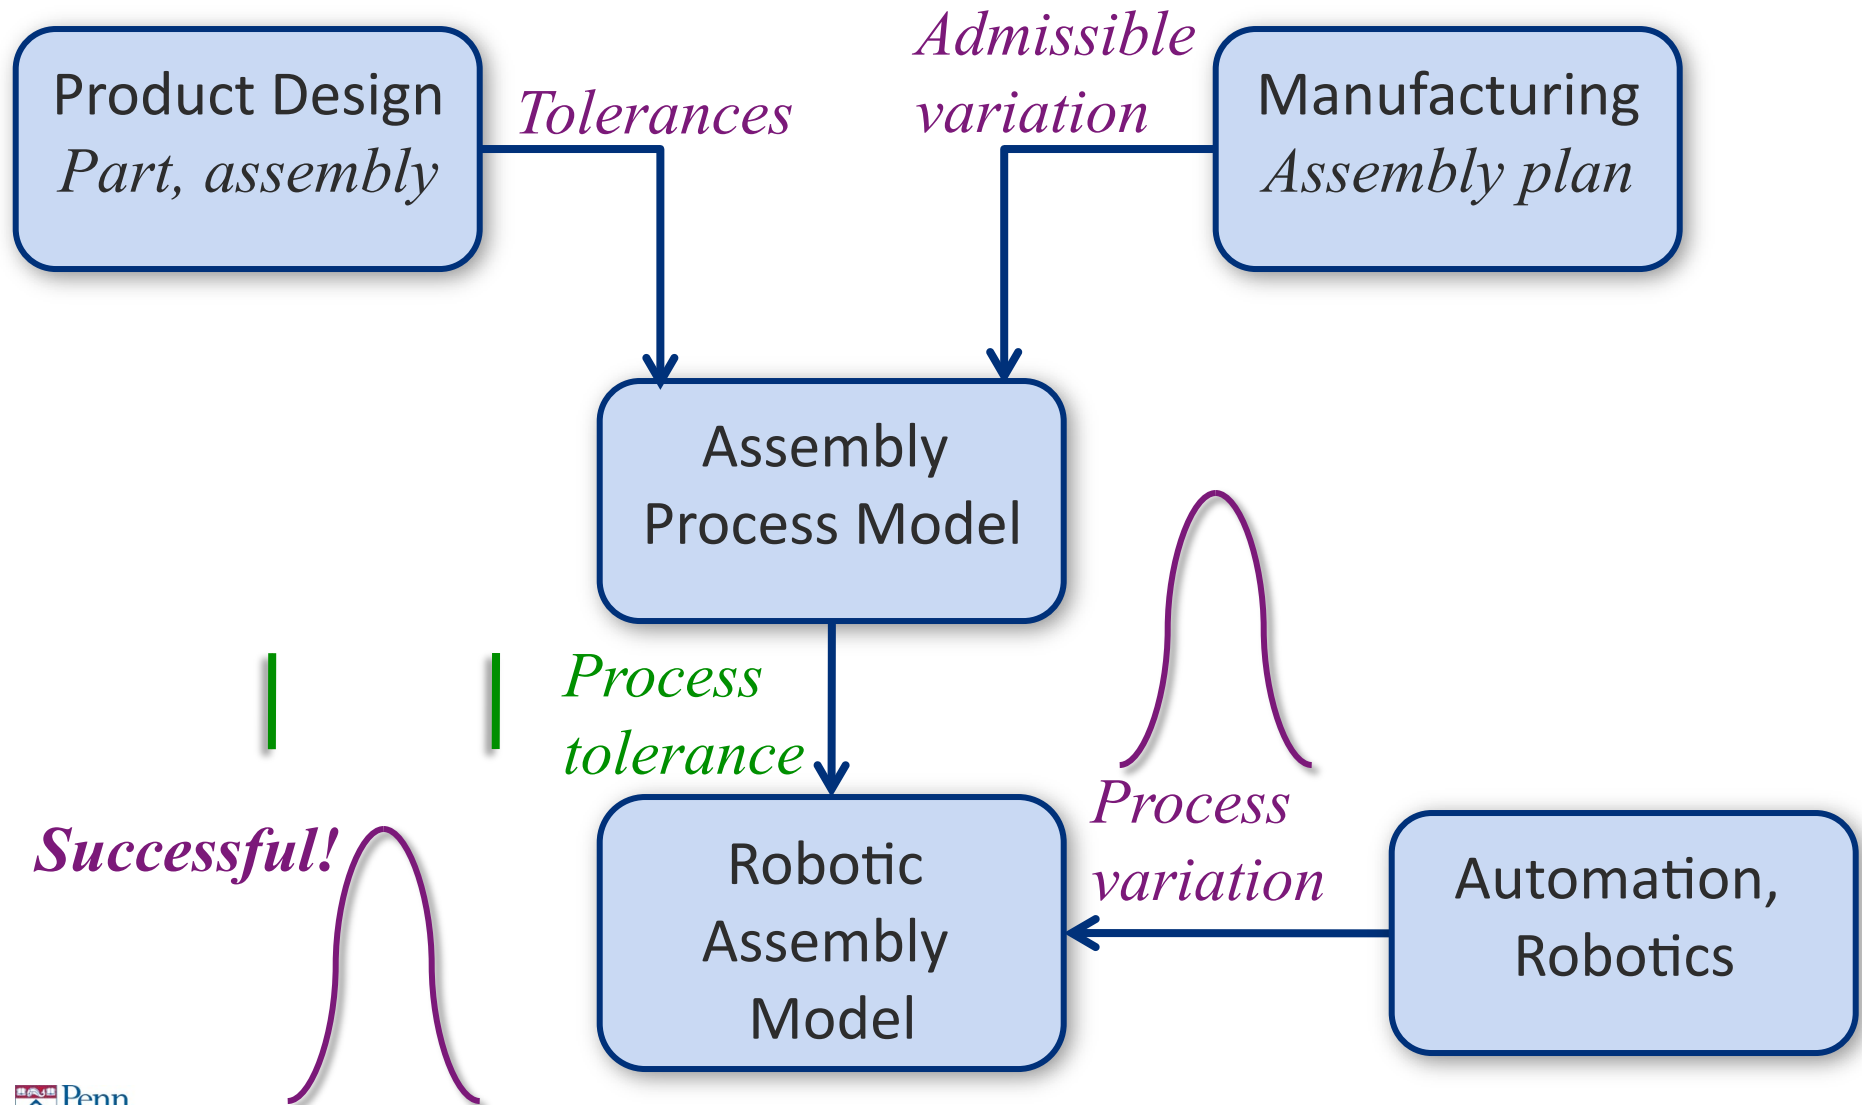

- Distributed assembly
- Unstructured environments

# Challenges

- Distributed assembly
- Unstructured environments
- Part design and payloads

# Robotic Assembly/Construction

# Conclusion

- Agile, small, aerial robots create new opportunities for robotics
- SWAP constraints
- Force feedback enables adaptation
- Networks enable functionality beyond what can be achieved by individual robots
